## Description

## Technical Field

5 [0001] The present invention relates to a novel benzazepine derivative, production and use thereof.

## Background Art

10 [0002] Recently, HIV (human immunodeficiency virus) protease inhibitors are developed for method of the treatment of AIDS (acquired immunological deficient syndrome) and use of the protease inhibitors in combination with conventional two HIV reverse transcriptase inhibitors provides with a further progress of the treatment of AIDS. However, these drugs and their combination use are not sufficient for the eradication of AIDS, and development of new anti-AIDS drugs having different activity and mechanism are sought for.

15 [0003] As a receptor from which HIV invades to a target cell, CD4 is so far known, and recently CCR5 as a second receptor of macrophage-tropic HIV and CXCR4 as a second receptor of T cell-tropic HIV, each of which is G protein-coupled chemokine receptor having seven transmembrane domains, are respectively found out. These chemokine receptors are thought to play an essential role in establishment and spread of HIV infection. In fact, it is reported that a person who is resistant to HIV infection in spite of several exposures retains mutation of homo deletion of CCR5 gene. Therefore, a CCR5 antagonist is expected to be a new anti-HIV drug. However, so far, there has been no report  
20 that a CCR5 antagonist is developed as a therapeutic agent of AIDS.

## Disclosure of the Invention

25 [0004] In order to investigate an anti-AIDS drug having CCR5 antagonistic activity, it is necessary to clone CCR5 gene from human tissue derived cDNA library, to ligate said gene with a vector for expression in animal cells, to introduce said gene into animal cells and to obtain cells expressing CCR5. In addition, with using this transformant, it is necessary to screen a compound which strongly inhibits binding of CC chemokine RANTES, natural ligand, to CCR5. However, so far there has been almost no report on a low molecule compound which has this CCR5 antagonistic activity and is suitable for oral administration. The present invention is to provide a novel anilide derivative which is useful for the  
30 treatment or prevention of infectious diseases of HIV and, in particular, AIDS and also which is suitable for oral administration, production and use thereof.

35 [0005] The present inventors diligently made extensive studies on compounds having CCR5 antagonistic activity and, as a result, they found that a benzazepine derivative of the following formula (I) or a salt thereof [hereinafter, referred to as Compound (I) in some cases] possesses CC chemokine receptor (CCR) antagonistic activity, in particular, potent CCR5 antagonistic activity and clinically desirable pharmaceutical effect (e.g. remarkable inhibition of HIV infection to human peripheral mononuclear cells, etc.) and also that Compound (I) has superior absorbability when orally administered. Based on the finding, the present invention was accomplished.

This tertiary amination reaction is carried out in an inert solvent such as methanol, ethanol, propanol, isopropanol, n-butanol, tetrahydrofuran, diethyl ether, dimethoxyethane, 1,4-dioxane, toluene, benzene, xylene, dichloromethane, chloroform, 1,2-dichloroethane, dimethylformamide (DMF), dimethyl sulfoxide (DMSO), pyridine, etc., or a mixture of these solvents. The reaction temperature is generally about 0°C to 180°C, and the reaction time is generally about 1 hour to about 40 hours. This reaction is preferably carried out under inert gas (e.g. nitrogen, argon, etc.) atmosphere.

(2) Compound (I) having a tertiary amino can be produced by reacting Compound (I-1) or (I-2) with an aldehyde compound in the presence of a reductive amination reagent such as triacetoxyborohydride, sodium cyanoborohydride, sodium borohydride, etc. The conditions of this reductive amination reaction vary depending on the reagent to be used. For example, when sodium triacetoxyborohydride is used, reaction is carried out in an inert solvent such as dichloromethane, chloroform, 1,2-dichloroethane, tetrahydrofuran, diethyl ether, dioxane, acetonitrile, dimethylformamide (DMF), etc., or a mixture of these solvents. In this case, about 1 to 2 moles of the reagent is used per mole of Compound (I-1) or (I-2). The reaction temperature is generally about 0°C to about 80°C, and the reaction time is generally about 1 hour to about 40 hours. This reaction is preferably carried out under inert gas (e.g. nitrogen, argon, etc.) atmosphere.

The reaction temperature is generally about  $-10^{\circ}\text{C}$  to about  $180^{\circ}\text{C}$ , and the reaction time is generally about 1 hour to about 40 hours. The reaction is carried out preferably under inert gas (e.g. nitrogen, argon, etc.) atmosphere.

wherein V' in Compound (V) is a halogen atom (bromine, iodine, etc.) or a sulfonyloxy group (trifluoromethanesulfonyloxy group, etc.), and the other symbols are as defined above.

[0078] Compound (I) wherein the group R<sup>1</sup> is a 5- to 6-membered aromatic ring group can be produced by subjecting Compound (V) to, for example, Suzuki reaction [cross condensation reaction of aryl borate with e.g. aryl halide or aryloxytrifluoromethane-sulfonate in the presence of a palladium catalyst; A. Suzuki et al., Synth. Commun. 1981, 111, 513]. Usually, about 1-1.5 times moles of aryl borate is used per mole of Compound (V) to obtain Compound (I).

[0079] The thus obtained Compound (I) can be isolated and purified by known separation and purification methods such as concentration, concentration under reduced pressure, extraction, crystallization, recrystallization, solvent convert, chromatography, etc.

[0080] Compound (II) used as a starting material can be produced by a known method (e.g. method described in JP-A-73476/1996, etc.) or the methods analogous thereto. For example, Compound (II) can be produced by a method described in the following Reaction Scheme I or II, a method described in the following Reference Examples or the methods analogous thereto.

## Reaction Scheme I

wherein  $R^9$  is a  $C_{1-4}$  alkyl group,  $R^5$  has the same meaning as the substituent represented by  $R^5$ , and the other symbols are as defined above.

[0081] In this reaction, the Compound (VI) is heated with polyphosphoric acid, or Compound (VI) is converted to acid chloride with thionyl chloride, oxalyl chloride, phosphorus oxychloride, phosphorus pentachloride, etc., followed by subjecting the resulting acid chloride to usual Friedel-Crafts reaction and cyclizing the same to produce Compound (VII). Compound (VII) is then reacted with carbonate ester in the presence of a base to produce ketoester (VIII). Compound (VIII) is subjected to reduction with catalytic hydrogenation or sodium borohydride, etc. to produce Compound (IX). Compound (IX) is subjected to dehydration by the conventional method to produce Compound (X). Compound (X) is subjected to ester hydrolysis to produce unsaturated carboxylic acid (II).

## Reaction Scheme II

wherein  $R^{10}$  is  $C_{1-4}$  alkyl group and the other symbols are as defined above.

[0082] The Compound (VIII) or (IX) can be produced by subjecting the Compound (XII) to Dieckmann condensation (J. P. Schaefer and J. J. Bloomfield, Org. Reactions, 1967, 15, 1). Compound (VIII) or (IX) is subjected to the reactions as described in Reaction Scheme I to produce unsaturated carboxylic acid (II).

[0083] Compound (III) can be produced by a known method (e.g. method described in JP-A-73476/1996, etc.) or the methods analogous thereto. For example, Compound (III) can be produced by a method described in the following Reaction Scheme III, a method described in the following Reference Examples or the methods analogous thereto.

Reaction Scheme 111

Examples of the reducing agent include metal such as reduced iron, zinc powder, etc.; alkali metal borohydride (e.g., sodium borohydride, lithium borohydride, etc.); metal hydride complex compound such as aluminum lithium hydride, etc.; metal hydride such as sodium hydride etc.; organic tin compound (triphenyltin hydride, etc.), metal complex compound and metal salt such as nickel compound, zinc compound etc.; catalytic reducing agent using hydrogen and transition metal catalyst such as palladium, platinum, rhodium, etc.; diborane; etc. Among others, as the reducing agent, catalytic reducing agent using hydrogen and transition metal catalyst such as palladium, platinum, rhodium, etc.; metal such as reduced iron, etc. are preferable. The reaction is carried out in a solvent which does not affect the reaction. Examples of the solvent include benzene, toluene, xylene, chloroform, carbon tetrachloride, dichloromethane, 1,2-dichloroethane, 1,1,2,2-tetrachloroethane, diethyl ether, tetrahydrofuran, dioxane, methanol, ethanol, propanol, isopropanol, 2-methoxyethanol, N,N-dimethylformamide, acetic acid, or a mixture of these solvents, etc. The solvent is appropriately selected depending on kind of the reducing agent. The reaction temperature is generally about -20°C to about 150°C, preferably about 0°C to about 100°C, and the reaction time is generally about 1 to about 24 hours.

40 [0085] The thus resulted Compound (II) or (III) can be separated and purified with know separation and purification methods such as concentration, concentration under reduced pressure, extraction, crystallization, solvent conversion, chromatography, etc.

## 5 Examples

### Test Example

#### (1) Cloning of human CCR5 chemokine receptor

[0098] Cloning of CCR5 gene was carried out by a PCR method from human spleen cDNA. With using 0.5ng of spleen cDNA (Toyobo, QUICK-Clone cDNA) as template, PCR was performed in DNA Thermal Cycler 480 (Perkin-Elmer) (reaction conditions: 30 cycles of 95°C for 1 minute, 60°C for 1 minute, and 75°C for 5 minutes) by adding each 25 pmol of primers of a primer set,

SEQ ID NO.: 1 described in Test Example (1) of WO 99/32100 [length of sequence: 34; type of sequence: nucleic acid; strandedness: single; topology: straight; kind of sequence: other nucleic acid synthetic DNA, and SEQ ID NO.: 2 described in Test Example (1) of WO 99/32100 [length of sequence: 34; type of sequence: nucleic acid; strandedness: single; topology: straight; kind of sequence: other nucleic acid synthetic DNA which were designed referring to nucleotide sequence of CCR5 gene reported by Samson et. al. (Biochemistry, 35(11), 3362-3367 (1996)) and by using TaKaRa EX Taq (Takara Shuzo). The resultant PCR product was subjected to agarose gel electrophoresis to collect about 1.0kb DNA fragment, which was subjected to Original TA Cloning Kit (Funakoshi) to carry out cloning of CCR5 gene.

#### (2) Preparation of plasmid for expression of human CCR5

[0099] The plasmid obtained in the above (1) was digested with restriction enzymes XbaI (Takara Shuzo) and BamHI (Takara Shuzo) and subjected to agarose gel electrophoresis to collect about 1.0kb DNA fragment.

[0100] The DNA fragment was mixed with plasmid pcDNA3.1 (Funakoshi) for expression in animal cells, said plasmid being digested with XbaI and BamHI, and they were ligated with DNA Ligation Kit Ver.2 (Takara Shuzo). The resulting plasmid was subjected to transformation of competent cell of E. coli JM109 (Takara Shuzo) to obtain plasmid pCKR5.

#### (3) Introduction of plasmid for expression of human CCR5 into CHO-K1 cell and Expression of said plasmid in CHO-K1 cell

[0101] CHO-K1 cells were grown in 750ml of tissue culture flask (Becton Dickinson) using Ham's F12 medium (Nihon Pharmaceutical) containing 10% fetal calf serum (Life Tech Oriental) and took off with 0.5g/L trypsin-0.2g/L EDTA (Life Tech Oriental). The cells were washed with PBS (Life Tech Oriental), centrifuged (1000rpm, 5 minutes), and suspended in PBS. With using Gene Pulser (Bio-Rad Laboratories), DNA was introduced into the cells under the conditions shown below. That is, to the cuvette of 0.4cm gap were added  $8 \times 10^6$  cells and 10μg of plasmid pCKR5 for expression of human CCR5, and electroporation was carried out under 0.25kV of voltage and 960μF of capacitance. The cells were transferred into Ham's F12 medium containing 10% fetal calf serum, and cultivated for 24 hours. The cells were again took off and centrifuged, and suspended in Ham's F12 medium containing 10% fetal calf serum and 500μg/ml of geneticin (Life Tech Oriental). The suspension was diluted to give 104 cells/ml of the suspension, which was inoculated on 96 well plate (Becton Dickinson) to give geneticin resistant cells.

[0102] The resulting geneticin resistant cells were cultivated in 96 well plate (Becton Dickinson), and cells expressing CCR5 were selected from the geneticin resistant cells. That is, in assay buffer (Ham's F12 medium containing 0.5% BSA and 20mM HEPES (Wako Pure Chemical, pH7.2)) to which was added 200pM of [<sup>125</sup>I]-RANTES (Amersham) as a ligand, a binding reaction was carried out at room temperature for 40 minutes, and the buffer was washed with cooled PBS. To the buffer was added 50μl/well of 1M NaOH, and the mixture was stirred. Radioactivity was determined with a γ-counter to select CCR5/CHO cells which specifically bind to the ligand.

#### (4) Evaluation of Test Compounds based on CCR5 antagonistic activity

[0103] The CCR5/CHO cells were inoculated on 96 well microplate ( $5 \times 10^4$  cells/well) and cultivated for 24 hours. The medium was removed by means of suction, and to each well was added an assay buffer containing Test Compound (1μM) and then 100pM of [<sup>125</sup>I]-RANTES (Amersham) as a ligand. A binding assay was carried out at room temperature for 40 minutes, and an assay buffer was removed by means of suction. Each well was washed twice with cooled PBS,

and 200 $\mu$ l of Microscint-20 (Packard Instrument, Inc.) was added to each well. Radio-activity was determined with Top-Count Micro Scintillation Counter (Packard Instrument, Inc.).

[0104] According to the method described above, inhibitory rate of Test Compound to CCR5 binding was measured. The results are shown in Table 1.

#### (5) Inhibitory effect on HIV-1 infection to MAGI-CCR5 cell

[0105] The plasmid where  $\beta$ -galactosidase gene was ligated downstream of HIV-1 LTR was introduced into CD4 positive HeLa cell, to which human CCR5 was further introduced to obtain transformant MAGI-CCR5.

[0106] By using said transformant MAGI-CCR5, a degree of HIV-1 infection was calculated using  $\beta$ -galactosidase activity (blue color due to decomposition of 5-bromo-4-chloro-3-indolyl- $\beta$ -D-galactopyranoside) as an index. Specifically, MAGI-CCR5 cells were suspended in DMEM medium containing 10% serum to prepare  $5 \times 10^4$  cells/ml suspension. To each well of 96 well plate was inoculated 200 $\mu$ l of the suspension, and the cells were cultivated at 37°C overnight. The medium was removed by means of suction, and to the residue was added 100 $\mu$ l of the above medium containing 1.6 $\mu$ M of Test Compound and 100 $\mu$ l of the above medium containing 300PFU of HIV-1 BA-L cells. The cells were cultivated at 37°C for 2 days. The medium was removed by means of suction. To the residue was added 200 $\mu$ l of a cell fixative (PBS containing 1% formaldehyde and 0.2% glutaraldehyde), and the mixture was allowed to stand at room temperature for 5 minutes and washed twice with PBS. To the mixture was added 100 $\mu$ l of staining solution (PBS containing 4 $\mu$ M potassium ferrocyanide, 4 $\mu$ M potassium ferricyanide, 2 $\mu$ M  $MgCl_2$  and 0.4mg/ml X-gal), and the mixture was allowed to stand at 37°C for 50 minutes and washed twice with PBS. The number of blue cells was counted by a microscope and defined as the number of cells infected with HIV-1. According to this method, inhibition rate on

HIV-1 infection was determined. The results are shown in Table 2.

#### Working Example 113 (Production of Compound 27)

[0545] To a solution of 7-[4-(2-butoxyethoxy)phenyl]-1-propyl-N-[4-[N-methyl-N-(tetrahydropyran-4-yl)amino]methyl]phenyl]-2,3-dihydro-1H-1-benzazepine-4-carboxylic acid (4.00g in THF (40ml)) were added thionyl chloride (1.72ml) and DMF (0.5ml) at room temperature, and the mixture was stirred for 1 hour. After concentration under reduced pressure, the residue was dissolved in THF (50ml) and DMF (10 ml), which was added dropwise to a mixture of 4-[N-methyl-N-(tetrahydropyran-4-yl)amino]methyl]aniline dihydrochloride (3.05g) and triethylamine (7.9ml) in THF (30ml) at 0°C. After stirred at room temperature for 16 hours, water was added to the reaction system, and the mixture was extracted with ethyl acetate. The organic layer was washed with saturated brine and dried with magnesium sulfate. After concentrated under reduced pressure, the residue was separated and purified with column chromatography (ethanol : ethyl acetate = 1 : 19), which was further purified by recrystallization (2-propanol) to give an end product (Compound 27) (4.19g) as yellow crystals.
